

ABSTRACT OF THE DISCLOSURE

The present invention provides a process for preparing a porous material having interconnected pores. One or more kinds of bioresorbable polymers and a low
5 molecular weight oligomer are dissolved in an organic solvent to form a bioresorbable polymer solution. The bioresorbable polymer solution is then exposed to a coagulant to form a porous material. The low molecular weight oligomer is soluble in the coagulant, and the
10 bioresorbable polymer is insoluble in the coagulant.
